reddit-photo-aggregator's is a library to scrape subreddits for images.
Check out the [Usage](#) section for further information, including

Note: This project is under active development.

CONTENTS

1.1 Installation

```
` pip install reddit-photo-aggregator `
```

1.2 Usage

To extract only the parts that you will need, use:

```
from reddit_photo_aggregator import SubReddit, ImageURLValidator, SortBy
```

Alternatively, import just the package:

```
import reddit_photo_aggregator
```

Set the image host whitelist using `.set_image_host_whitelist()`

```
ImageURLValidator.set_image_host_whitelist([
    'i.redd.it',
    'i.imgur.com',
])
```

Set the file extension whitelist using `.set_image_extension_whitelist()`

```
ImageURLValidator.set_image_extension_whitelist([
    'png',
    'jpeg',
    'jpg'
])
```

Create a `SubReddit` object with the sub-reddit name that you want to aggregate images from

```
sub = SubReddit('r/LandscapePhotography')
```

You can then discover images, this can be sorted using the `SortBy` class, this will also give you the amount of images found and the `sub.loaded_images` becomes filled out

```
amount = sub.discover_images(SortBy.hot)
print(amount)
print(sub.loaded_images)
```

Save the images to an /images directory.

```
for image in sub.loaded_images:
    print(f'Saving to {image.filename}')
    image.save(to='./images')
```

1.2.1 Full Example

```
from src import SubReddit, ImageURLValidator, SortBy

ImageURLValidator.set_image_host_whitelist([
    'i.redd.it',
    'i.imgur.com',
])
ImageURLValidator.set_image_extension_whitelist([
    'png',
    'jpeg',
    'jpg'
])

sub = SubReddit('r/LandscapePhotography')
amount = sub.discover_images(SortBy.hot)
print(amount)

for image in sub.loaded_images:
    print(f'Saving to {image.filename}')
    image.save(to='./images')
```

1.3 Reference

library to scrape subreddits for images.

class reddit_photo_aggregator.**ImageURLValidator**

Image URL validation class to validate image URLs before attempting to download them

classmethod **set_image_extension_whitelist**(*extension: list[str]*) → None

Set the image extensions that are allowed to be downloaded

Parameters

host (*list[str]*) – list of image extensions

classmethod **set_image_host_whitelist**(*host: list[str]*) → None

Set the domain hosts that are allowed to be downloaded from

Parameters

host (*list[str]*) – list of host domains

class reddit_photo_aggregator.**SubReddit**(*name: str*)

discover_images(*sorted_by='/hot'*) → int

Aggregates images from the subreddit feed

Parameters

sorted_by (*str*, *optional*) – *SortBy* value to sort the results by. Defaults to *SortBy.hot*.

Returns

the amount of images found

Return type

int

property loaded_images: list[[reddit_photo_aggregator.image.Image](#)]

List of *Image* loaded when running *.discover_images*

Returns

List of discovered image

Return type

list[[Image](#)]

property url: str

The URL of the subreddit based on *name*

class reddit_photo_aggregator.**Image**(*url: str*)

Image object used to store and load the image content from URL

property filename: str

the filename that the image will be saved using

load() → None

Retrieves the image content from the URL

Raises

ImageRetrieveError – When resource returns any status code other than 200

save(*to: str = './*)

Saves the image to disk

Parameters

to (*str*, *optional*) – Additional path to append to cwd. Defaults to './'.

class reddit_photo_aggregator.**SortBy**

Used to sort sub-reddit results

controversial = '/controversial'

hot = '/hot'

new = '/new'

rising = '/rising'

top = '/top'
